

Hi Rong Xiao,

For the majority of the marking, the video is where the student will explain every detail of their app they have created by running in an emulator (or they can screen record a physical device). I also have a deployment mark for showing the app deployed to another device, such as an Android tablet that can also be emulated.

There are 2 main criterion that you mark outside of the video: GitHub usage, and Code Quality.

The criteria I use below has some notes on how I mark:

- UI/UX Design and Accessibility (30%)
-

The look and feel of the app, and how it meets accessibility guidelines, such as the web content accessibility guidelines (WCAG). These can be demonstrated in the video, as the marker can see the app, and the student can outwardly explain how they meet the guidelines, with higher marks if they can reference verbally (or show on screen through edits) the exact principles they met

- Use of mobile hardware (20%)
-

- All mobile hardware can be shown through an emulator, **except** vibration, haptic feedback, and the flash. For those latter features, they would only count as being implemented if the student shows those in the code on-screen where it was implemented. All other features, such as camera, any virtual sensors, can be shown in the emulator or physical device

- A list of hardware features I count: Camera (using both the front and back camera only counts as 1 feature), Microphone, Accelerometer, Gyroscope, Magnetometer, Barometer, Shake, Compass, Flash (needs to be implemented in code, not just used as the in-built function on the camera), Location/geolocation/geocoding (can be spoofed in an emulator rather than a real location), Haptic feedback and vibration (using both only counts as 1 feature), Text-to-speech

-

A list of features that **do not** count as hardware: Battery level, Orientation, Device information, Buttons or any other UI element, Speaker, Touch screen gestures, Storage, Databases

-
- Functionality (20%)

Features such as buttons, gestures, interesting novel approaches. All can easily be shown in the video and explained by the student

-
- Validation and Error Handling (10%)

-
- Some of these can be shown in the video, such as pop-up messages to the user and user-friendly error messages (I cut marks if the messages are like a programmer wrote them, such as "Null pointer error"). You could give some marks if they show some error/validation code on-screen, but you can also give marks for the code they submit on GitHub that shows good practice in error/validation.

-
- Code Quality (10%)

-
- This is one of the 2 main criterion that are marked outside of the video. You mark on best coding practices, good variable naming conventions, classes, functions, reusability of code etc.

-
- Deployment (5%)

-
- Deploying to another device and should be shown in the video. One of the simplest ways to do this is for the student to show off their app using an Android emulator phone and then show the features again (including hardware) on an Android tablet emulator. The latter does not need to be as in-depth, as long as they show it briefly working.

-
- GitHub Usage (5%)

The second criteria that is marked outside of the video. If the student did not commit at all to GitHub, this would be a 0. I do not allow any code to be submitted outside of these repositories to help show their development and minimise plagiarism or misconduct.

I cannot say personally around the submission aspect, so please take advice from someone more closely involved with the assessment, but as each student is assigned their own repository, for my submissions, I get them to submit their repository link, so any marker can see the code but no one else can.

I hope this helps.

Regards,

Dr Adrian Davison | Senior Lecturer | Department of Computing and Mathematics | Manchester
